Received 26 February 2011; accepted 5 March 2011

Key indicators: single-crystal X-ray study; $T = 293$ K; mean $\sigma(\text{C}—\text{C}) = 0.004$ Å;
 R factor = 0.052; wR factor = 0.131; data-to-parameter ratio = 15.4.

In the title compound, $\text{C}_{37}\text{H}_{50}\text{O}_5$, the central benzene ring makes dihedral angles of 39.72 (14) and 64.43 (13)° with the benzyl and 3-methoxybenzoate rings, respectively. The crystal structure is stabilized by intermolecular $\text{C}—\text{H} \cdots \pi$ interactions involving the central benzene ring and the benzene ring closest to the aliphatic chain.

Related literature

For general background to 4-(hexadecyloxy)-3-methoxybenzoate, see: Parker *et al.* (1977); Nessim (2011); Sadashiva & Subba (1975); Castellano *et al.* (1971). In a three-ring system, when two rings are linked by a unit which preserves conjugative interaction and molecular rigidity, the second linking unit can be more flexible, see: Gray (1976).

4-(Benzyloxy)phenyl 4-hexadecyloxy-3-methoxybenzoate

W. F. A. Al-Eryani, H. T. Srinivasa, S. Jeyaseelan, T. Sadashivaiah and H. C. Devarajegowda

Comment

Many organic compounds exhibiting liquid crystalline properties contain two phenyl rings with substituents in the *para* positions. On moving from two-ring mesogens with one linking unit to three-ring mesogens with two linking units, meso-phase thermal stabilities are greatly enhanced. In a three-ring system, when two rings are linked by a unit which preserves conjugative interaction and molecular rigidity, the second linking unit can be more flexible (Gray, 1976).

The electron-rich title compound, 4-(benzyloxy)phenyl 4-(hexadecyloxy)-3-methoxybenzoate has a long flexible aliphatic chain with a bulky, laterally substituted methoxy group at one end and the other end having a hydrophobic benzyl group. Lateral and terminal substitution lead to a significant change in some of the properties of compounds having medical importance and also in obtaining desired properties in mesogenic materials (Parker *et al.*, 1977; Nessim, 2010; Sadashiva *et al.*, 1975). With this background, we have synthesized (Castellano *et al.*, 1971) the title compound, 4-(benzyloxy)phenyl 4-(hexadecyloxy)-3-methoxybenzoate, and here we report its crystal structure.

The crystal structure of the title compound contains one molecule in the asymmetric unit (Fig. 1). The dihedral angle between the aromatic rings are: A/B, B/C and A/C 39.72 (14)°, 64.43 (13)° and 24.72 (13)°, respectively. The alkyl chain and aromatic ring C make a dihedral angle of 5.71 (10)°. The packing of the molecules is stabilized by intermolecular C6—H6···Cg2 and C22—H22B···Cg3 interactions, where Cg2 and Cg3 are the centroids of rings B and C, respectively (Table 1). The packing of the molecules in the title structure is depicted in Fig. 2.

Experimental

A mixture of 4-(hexadecyloxy)-3-methoxybenzoyl chloride (5 mmol) was added to 4-(benzyloxy)phenol (5 ml) in 5 mol of dry dichloromethane. The resultant mixture was stirred at room temperature for 30 min and heated for 10 min at 338 K, then poured into ice-cold hydrochloric acid and extracted with dichloromethane. The combined organic layers were washed with water and dried. Evaporation of the solvent under vacuum yielded a white solid material which was recrystallized from pure dichloromethane at room temperature. The yield was about 92%. M.p. 358 K. Elemental analysis for C₃₇H₅₀O₅ requires C 77.31%, H 8.77%. Found C 76.98%, H 8.35%.

Refinement

All H atoms were placed at calculated positions with C—H = 0.93 Å for aromatic H, 0.97 Å for methylene H and 0.96 Å for methyl H. They were refined using a riding model with $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{C})$ for methyl H and $1.2U_{\text{eq}}(\text{C})$ for all other H.

Figures

Fig. 1. The title molecule with displacement ellipsoids drawn at the 50% probability level. H atoms are shown as small spheres of arbitrary radius.

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.052$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.131$	H-atom parameters constrained
$S = 0.91$	$w = 1/[\sigma^2(F_o^2) + (0.0564P)^2]$
5841 reflections	where $P = (F_o^2 + 2F_c^2)/3$
379 parameters	$(\Delta/\sigma)_{\text{max}} < 0.001$
0 restraints	$\Delta\rho_{\text{max}} = 0.13$ e Å ⁻³
	$\Delta\rho_{\text{min}} = -0.16$ e Å ⁻³

Special details

Experimental. *CrysAlis PRO*, Oxford Diffraction Ltd., Version 1.171.33.55 (release 05-01-2010 CrysAlis171. NET) Empirical absorption correction using spherical harmonics, implemented in SCALE3 ABSPACK scaling algorithm.

Experimental data is IR (KBr) cm⁻¹; 2912(C—H aromatic stretch), 2870 (C—H aliphatic stretch), 1730 (C=O stretch), 1597 (C=C stretch).

Geometry. All s.u.'s (except the s.u. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell s.u.'s are taken into account individually in the estimation of s.u.'s in distances, angles and torsion angles; correlations between s.u.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell s.u.'s is used for estimating s.u.'s involving l.s. planes.

supplementary materials

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > 2\sigma(F^2)$ is used only for calculating R -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.

Hydrogen-bond geometry (\AA , $^\circ$)

Cg2 and Cg3 are the centroids of the C8—C13 and C14—C20 rings, respectively.

$D-H\cdots A$	$D-H$	$H\cdots A$	$D\cdots A$	$D-H\cdots A$
C6—H6 \cdots Cg2 ⁱ	0.93	2.97	3.576 (3)	124
C22—H22B \cdots Cg3 ⁱⁱ	0.96	2.94	3.793 (2)	148

Symmetry codes: (i) $x-2, y, z+1$; (ii) $x+1, y, z$.
